## **DETAILED ACTION**

### ***Continued Examination Under 37 CFR 1.114***

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 11/21/2003 has been entered.

### ***Allowable Subject Matter***

2. Claims 1-18 are allowed.
3. The following is an examiner's statement of reasons for allowance:

Applicant has amended claim one to claim that the antistatic layer has a thickness between 100 and 200 nm and containing conductive particulates. Although as has been established in previous office actions, most recently the final rejection mailed on 7/22/2003, antistatic layers provided on the outer surfaces of holding frames, pair of substrates, and other parts of an electro-optical apparatus (projector) are well known and further in that same office action and previous office actions it has been established that the Markush group of elements which make up the conductive particulates in the antistatic layer are well known (it should be noted that applicant has canceled those elements/compounds listed in the previous rejection's prior art, however as will be established other elements of the Markush group are well known equivalents to those elements that have been

canceled); the specific thickness of between 100 and 200 nm is not well known.

US 6,623,662 to Wang et al., teaches an anti-reflective/anti-static coating that is taught in column 3 lines 55 and 56 to be 0.1 microns (100 nm) thick and includes members of the above group (specifically tin oxide), however as shown in figure 2 said anti-reflective/anti-static coating is made of two layer 46 and 48, where 46 is the antistatic layer and obviously from inspection would therefore be less than 0.1 microns. US 2003/0090195 to Teng teaches a similar layer and specifically specifies that the antistatic layer is 18-35nm (see paragraph 21). Teng further teaches in paragraphs 3 and 4 that it is well known to use Ag-Pd, Ag-AU, TiN, for antistatic layers.

Since the specific thickness of the Anti-static layer alone was not found in the prior art, claim 1 is allowable. Claims 2-18 are dependent on claim 1 and are therefore also allowed.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
